

Exercise 1 (Example of Type Inference for let)

Consider the typing problem

$$x : \alpha \vdash \text{let } y = \lambda z. z \ x \text{ in } y \ (\lambda v. x) : ?\tau$$

where α is a type variable.

- a) Find the most general type schema σ with $x : \alpha \vdash \lambda z. z \ x : \sigma$ and draw a type derivation tree.
- b) Draw the type derivation tree for

$$x : \alpha, y : \sigma \vdash y \ (\lambda v. x) : ?\tau$$

with the correct type for $?\tau$.

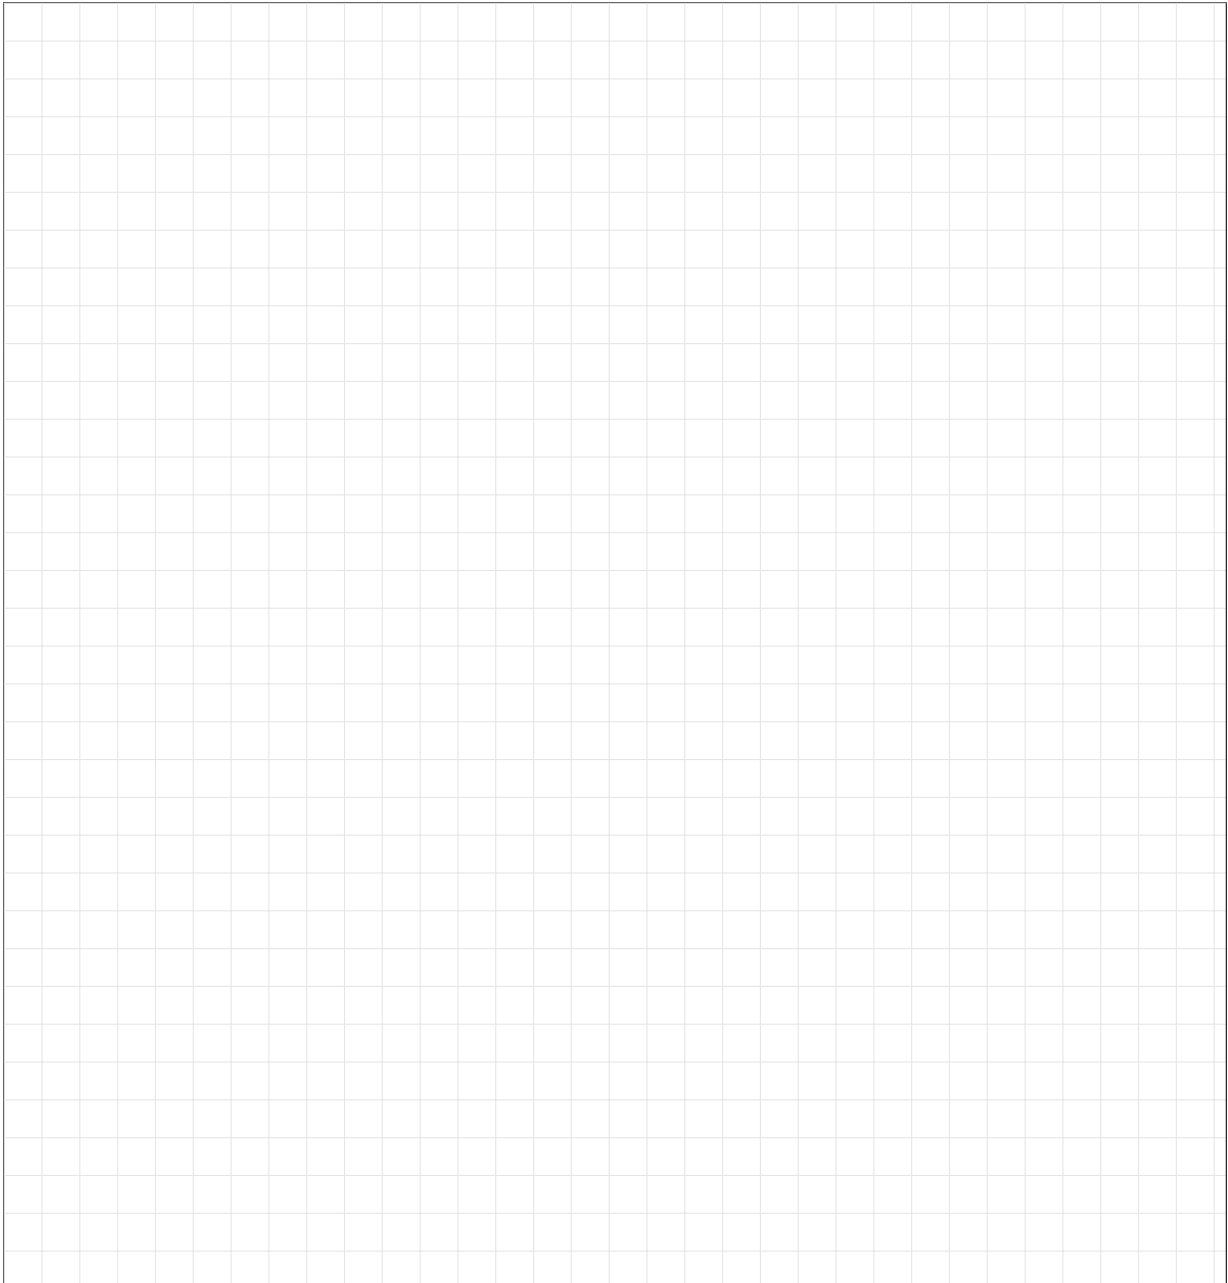

Exercise 2 (Recursive let)

Recursive `let` expressions are one way (besides Y -combinators) to add recursion to λ^\rightarrow .

$$t ::= x \mid (t_1 t_2) \mid (\lambda x. t) \mid \mathbf{letrec} \ x = t_1 \ \mathbf{in} \ t_2$$

- a) Modify the standard typing rule for `let` to create a suitable rule for `letrec`.
- b) Considering *type inference*, what is the problematic property of this rule compared to the rule for `let`?

Exercise 3 (Type Inference in Haskell (2))

Extend the implementation of the type inference algorithm from the last exercise with `let` and `letrec` constructs.

Homework 4 (Fixed-point combinator)

Let

$$\$ = \lambda abcdefghijklmnopqrstuvwxyzr. r(\text{thisisafixedpointcombinator})$$

and

$$\text{\textcircled{€}} = \$.$$

Show that $\text{\textcircled{€}}$ is a fixed-point combinator.

Homework 5 (let-Polymorphism)

Give a derivation tree for the following statement, and so determine the type τ :

$$[z : \tau_0] \vdash \text{let } x = \lambda y z. z y y \text{ in } x (x z) : \tau$$

Homework 6 (Towards Syntax-Directed let-Polymorphism)

In the lecture, it was claimed that the systems DM and DM' , which, in contrast to DM , has explicit rules $\forall\text{Intro}$ and $\forall\text{Elim}$, are essentially equivalent. More specifically, it was claimed that

$$\Gamma \vdash_{DM} t : \sigma \implies \exists \tau. \Gamma \vdash_{DM'} t : \tau \wedge \text{gen}(\Gamma, \tau) \preceq \sigma.$$

As a step towards proving this result, we want to rearrange derivations in DM such that they resemble derivations in DM' . In particular, prove that

- a) Any derivation $\Gamma \vdash_{DM} t : \sigma$ can be transformed such that $\forall\text{Elim}$ only occur in a chain below the Var rule, i.e.

$$\frac{\frac{\Gamma \vdash x : \forall \alpha_1, \dots, \alpha_n. \tau}{\Gamma \vdash x : \forall \alpha_1, \dots, \alpha_n. \tau} \text{Var}}{\Gamma \vdash x : \forall \alpha_1, \dots, \alpha_n. \tau} \forall\text{Elim}$$

$$\vdots$$

$$\frac{\Gamma \vdash x : \forall \alpha_n. \tau}{\Gamma \vdash x : \forall \alpha_n. \tau} \forall\text{Elim}$$

$$\frac{\Gamma \vdash x : \forall \alpha_n. \tau}{\Gamma \vdash x : \tau} \forall\text{Elim}$$

$$\vdots$$

- b) Any derivation $\Gamma \vdash_{DM} t : \sigma$ can be transformed such that $\forall\text{Intro}$ only occur in a chain that is terminated by an application of the Let rule or by the end of the proof, i.e.

$$\frac{\frac{\frac{\frac{\vdots}{\Gamma \vdash t_1 : \tau}}{\Gamma \vdash t_1 : \forall \alpha_n. \tau} \forall\text{Intro}}{\Gamma \vdash t_1 : \forall \alpha_n. \tau} \forall\text{Intro}}{\Gamma \vdash t_1 : \forall \alpha_1, \dots, \alpha_n. \tau} \forall\text{Intro} \quad \frac{\Gamma[x : \forall \alpha_1, \dots, \alpha_n. \tau] \vdash t_2 : \sigma}{\Gamma[x : \forall \alpha_1, \dots, \alpha_n. \tau] \vdash t_2 : \sigma} \text{Let}}{\Gamma \vdash \text{let } x = t_1 \text{ in } t_2 : \sigma} \text{Let}$$

or

$$\frac{\frac{\frac{\vdots}{\Gamma \vdash t_1 : \tau}}{\Gamma \vdash t_1 : \forall \alpha_n. \tau} \forall\text{Intro}}{\Gamma \vdash t_1 : \forall \alpha_1, \dots, \alpha_n. \tau} \forall\text{Intro}$$
